SUMMARY

iOS software engineer with 13+ years in Objective-C and Swift, building production systems that fuse hardware signals with software: BLE + GPS sensor-fusion positioning, on-device ML pipelines over very large data sets, and location-aware consumer navigation. Strong computer-science foundations — concurrency, memory management, and debugging complex systems in production. Took technologies from evaluation and prototyping through to production, and shipped three products solo from concept to the App Store.

CORE SKILLS

Languages	Objective-C · Swift · Kotlin (KMP) · Python
Sensors & Location	BLE beacon positioning · GPS fusion · real-time routing & live map rendering · motion across floor/context transitions
Systems	Multithreading & Swift Concurrency · memory management (ARC) · caching · batching/queuing pipelines · background execution
On-Device	Core ML inference at scale · performance under memory/battery constraints · Instruments (Allocations, Time Profiler)
Engineering practice	Software design paradigms · modular architecture (SPM) · unit testing (XCTest) · code review · debugging production systems (Crashlytics)
Delivery	App Store Connect · TestFlight · full release cycle · CI/CD · Git

PROFESSIONAL EXPERIENCE

Senior iOS Engineer · Shutterfly, Haifa, Israel — 2017 – May 2026

- Architected and implemented the APC photo scoring engine — taken from technology evaluation and prototyping to production: a multithreaded batching/queuing pipeline running Core ML inference over very large photo libraries, engineered for memory pressure, battery, and background execution.
- Debugged complex production systems across a fragmented device/OS landscape — Crashlytics monitoring, Instruments profiling, root-cause analysis and fixes.
- Established feature-based modularization with SPM — explicit dependency graphs, reusable components, code review culture.
- Delivered releases end to end through App Store Connect and TestFlight.

iOS Engineer — Indoor Navigation · Spreo — 2013 – 2015

- Built location technologies for hospitals, campuses, and malls — **BLE beacon positioning fused with GPS** for facility identification and continuous indoor/outdoor localization, working directly with hardware signal characteristics (signal strength, calibration, noise).
- Implemented turn-by-turn navigation over proprietary routing — live route rendering across outdoor-to-indoor and floor transitions with real-time position updates.

iOS Engineer — SDK & Interactive Media · Apester — 2015 – 2017

- Designed and shipped a publisher-facing iOS SDK (Objective-C era) — public API design, versioned releases, rendering performance under high-frequency updates in host apps.

INDEPENDENT PRODUCTS — CONCEPT → PRODUCTION, SOLO

Modu: Paths — Goals & Habits App · App Store & Google Play · Swift · Kotlin · KMP

- Sole owner: architecture, local persistence, cross-platform sync — business logic written once in Kotlin Multiplatform, consumed natively.

StudyHub — AI Course-Generation Platform · studyhub.academy · Python · Postgres

- Sole engineer: 9-stage LLM pipeline behind a model-agnostic gateway; durable job queue with heartbeat leases and auto-resume — production systems engineering end to end.

Sonic Player — Native Audio Engine · App Store · SwiftUI · AVFoundation

- Background playback, variable speed, Now Playing; migrating from TCA to Clean Architecture.

EDUCATION

- B.Ed, Software & Electronics — ORT Colleges · currently pursuing B.Sc. studies, The Open University of Israel
